Application Details • Applicant
Details • Fees and Guarantee
Administration • Process and
Workflow • Approvals •
Progress Monitoring •
Document Management •
Objection Management • Mail
Merge and Letter Generation •
Updating of Property Register
• Statistical Analysis and
Reporting

TOWN PLANNING APPLICATION TRACKING

In-Depth Data, formed in 1990, proudly presents a range of specialized software modules to manage critical town planning processes. These processes include:

- Applications for township establishment
- Applications for subdivisions and consolidations
- Applications for rezoning

These applications are intricate and must follow predefined processes governed by South African law. As a result, applicants usually employ the services of professional town planners and land surveyors to represent them and submit their applications. This is a costly process and so it is imperative for competitive councils to administer these applications in an equally professional manner. It is part of the service ethic.

PROPERTY REGISTER MAINTENANCE

Noteworthy, these applications are the backbone of organized urban development, increasing the value of the municipal valuation roll - the base for the council's revenue stream. Clearly, failure to effectively and efficiently administer these applications results in substantial loss of income to councils.

This is especially the case for large municipal bodies, where the volume and detail involved in such applications ensures application management is complex. For example, numerous internal departments and external organizations must be informed of the application and are themselves required to give feedback within specified times frames.

To this end, In-Depth Data developed specialized Planner application tracking software to ensure your council remains competitive, efficient and professional. Contact us for more information.
